

In Public Health, there is an assortment of fields that an individual can work in. Because Public Health is so broad, the collateral field helps focus a student's interests and provide more in-depth knowledge about a certain subject from a variety of different areas that build on skills needed to succeed in Public Health.

An example that would satisfy the collateral field relating to Public Health is by taking classes about human disease. Some classes may include: Biology of Cancer and AIDS, Medical Microbiology, Infectious Disease and Defense, and Plagues: The Ecology of Disease. Information from these classes would provide an understanding of human diseases. A combination of knowledge from the collateral field and information from Public Health would make the student more aware of issues that arise as a result of poor health and ways to solve the problems.
