What is HPV?
Human Papillomavirus (HPV) is the most common sexually transmitted infection. HPV...

• affects people of all genders.
• is spread by skin-to-skin contact with an HPV-infected area.
• is the cause of most genital cancers.

Are you protected?
A series of three vaccinations is a safe and effective way to protect against HPV, but in Massachusetts, only 39.3% of young females and 21.8% of young males have had all three.

Check to see if you have had the full series. If not, bring us your records and get back on track!
